Criteria	What that Might look like	Question to Ask	Point Summary	Accomplished 5 points	Advanced 4 points	Intermediate 3 points	Beginning 2 points	Developing 1 point
Innovation Challenge the norm by analyzing existing solutions through testing or research, then exploring ways to improve or reinvent.	This might look like a project that improves an existing solution in a way that increases value (access, affordability, opportunity, empowerment). It may also be a brand-new approach or potential solution that addresses a problem. Both cases involve a team identifying a problem and examining existing solutions.	How did your team challenge commonly accepted ideas and what did you do differently in your project?	**5 pt**. Did research and Analysis, explored alternatives to create a more successful solution. **4 pt**. Did research and analysis but did not explore alternative solutions **3 pt**. Did research to provide context but did not complete analysis. **2 pt**. No research or analysis but worked within an already identified area of improvement. **1pt**. No research or analysis and no areas of improvement identified.	The team based their project on research and analyzed currently accepted solutions to identify strengths or weaknesses, and explored one or more new or alternative successful solutions.	The team developed a project, conducted research on existing solutions, analyze current accepted solutions to identify strengths or weaknesses, but did not explore new or alternative solutions.	The team developed a project, conducted research on existing solutions, but did not analyze current accepted solutions to identify strengths or weaknesses, and did not explore new solutions.	The team developed a project, and did not examine existing solutions for potential improvements, instead used an already known or given area of improvement.	The team developed a project but did not research or analyze existing solutions and no potential improvements was identified.
Curiosity Being curious, ask questions that inspire growth and result in the artful application of scientific principals.	This might look like a team that questioned existing limitations, a team that sought to discover an unaddressed problem, a project that is outside of the box or a project that leveraged unique ideas and processes.	Can you share some examples of questions your team asked while exploring possibilities? Show us something unique, beautiful or clever in your project.	**5 pt.** Acted on plan. **4 pt**. Plan made to explore answers and improve project **3 pt**. Relevant new or unique questions asked as a team. **2 pt**. Some questions asked **1 pt**. No questions asked.	The team worked together to identify knowledge gaps, asking unique or new questions, and acted on that plan to explore create to project outcomes.	The team worked together to identify knowledge gaps, asking unique or new questions, and made a plan that explored answers to improve project outcomes.	The team worked together to identify knowledge gaps, asking unique or new questions to bridge gaps.	The team asked questions to better understand their area of interest.	The team did not ask questions that addressed their understanding of the project topic areas.
Communication Effectively communicating project concepts including a visual representation that explains the project's development process and purpose.	This can been seen in a team's project video or slide deck as well as the examples shared during the interview process. It may be a slide deck, a physical prototype, poster, video or other representation that describes their project and process.	What part of your presentation shows off your work best? Can you show me your prototype and how it explains your concept?	**5 pt**. Prototype with essential functional elements **4 pt**. Prototype and detailed presentation **3 pt**. Detailed representation. **2 pt**. Basic representation. **1 pt**. No representation.	The team communicates their idea through a functional prototype of their project's essential elements including sketches, drawings, diagrams, etc.	The team communicates their idea through a prototype of their project's essential elements and sketches, drawings, diagrams, etc.	The team communicates their project's idea through detailed sketches, drawings, diagrams, etc. representing essential elements OR has a prototype with out any additional detialed documentation.	The team communicates their project's idea through basic sketches, drawings, diagrams, etc. representing some elements.	Team does not present a prototype or representation of their project.
Project Breadth and Complexity Leveraging knowledge and skills from the humanities, engineering, and science to successfully make complex/nontrivial new innovations.	This might look like the use of diverse frameworks, APIs, data or perspectives and programming best practices. Teams may use resources from different domains like Medicine + Robotics or Environmental Sciences + Economics. It may also include projects that consider future growth or scalability and sustainability connecting current needs and future needs with flexible concept that might be a sustainiable future oriented solution.	How did you use information from two different areas to explore a new idea? What was the most complicated piece of this project to build? What changes if this project is scaled? What could this project look like if it was 10X as big or reached 10X the people?	**5 pt**. Synthesize ideas from a wide variety and new innovation **4 pt**. One or more ideas from more than one knowledge area, must include knowldge from an area or expertise not directly related to computing **3 pt**. One or more ideas from more than one technical knowledge area **2 pt**. One or more idea from a single technical knowledge area **1 pt**. A single idea from a single knowledge area	Synthesize ideas from a wide variety of sources across humanities, science and engineering to create something new, future oriented and effectively complex.	Connect ideas from more than 2 sources, across different areas of humanities, engineering, and science.	Connect ideas from more than one technical area of knowledge.	Connect ideas from the same technical area of knowledge or skill	Team does not connect more than one idea to inform their concept.
Impact The project seeks to provide a solution with potential social, economic/busines, environmental or other tangible value.	This could look like project with well defined user needs or projects that consider the reach, adoption and long term effects of it's implementation.	What does your project improve or who might it help? What user needs did you keep in mind while working on this? Did you get any feedback from your target audience about your proposed solution?	**5 pt**. Concept is detailed, justified, and feasible. **4 pt**. Detailed concept with clear value proposition but not possible. **3 pt**. Features Identified and refined **2 pt**.Features identified **1 pt**. No features identified.	The team proposes and justifies a detailed concept (solution, prototype) with potential social, economic, or environmental value and it is feasible for development.	The team proposes and justifies a detailed concept (solution, prototype) with potential social, economic, or environmental value but it is not feasible for development.	The team refines the features of their solution using research to enhance the potential social, economic, and environmental value.	The team identifies features of their solution with potential social, economic, and environmental value.	The team does not identify features of their solution with potential social, economic, or environmental value.
Navigating challenges Testing ideas, recognizing barriers or failures as important moments of feedback and pivoting accordingly.	This might look like teams who chose a crucial pivot in their project due to a gap in knowledge or a team that made changes to their project after testing it and discovering a problem.	Name one thing that you struggled with or something that just didn't work at all and how did you pivot your plan from there. How did your test your ideas and make changes based on the results?	**5 pt**. Alternatives created more successful solution **4 pt**. Alternatives implemented **3 pt**. Alternatives considered **2 pt**. Something identified **1 pt**. Nothing identified.	Team demonstrated that they reflected on their failures and shifted their approach to create a more successful solution based on identified lessons learned.	The team identifies failures or areas of improvement, reflects on alternative approaches, and implements alternatives based on identified lessons learned.	The team identifies failures or areas of improvement and demonstrates reflection through the consideration of alternative approaches.	The team identifies failures or areas of improvement in their approach.	The team did not identify failures or areas of improvement in their approach.
